Powerful, high capacity elevator sweeper with suction unit.
For application on ordinary truck chassis.

BRODD MASTER[®]

Truck mounted high capacity elevator sweeper

Simple, sturdy and silent The sweeping principle

Both side brushes (4) sweep the dirt into the middle of the sweeper, the wide roller brush (1) throws the debris up into the feeding worm (2) further up to the elevator (3) equipped with easy replaceable rubber rakes - transports it into the litter hopper (5). The suction system (option) (6) prevents the dust and it gets **clean - faster and even more efficient!**

Suction system (option)

Master sweeper can be equipped with an effective suction ventilator for collection of the fine dust which is usually created during the sweeping operation.

Easy maintenance

Easy availability for service and maintenance of the sweeping unit. Just remove the covers and you have full access for simple maintenance.

Remote control system

Everything in view from driver's seat. All functions of the sweeping unit can be operated from this control box. The switches are equipped with lights.

High dumping litter hopper with 3200 mm dumping height

You can dump directly on the platform body of a truck.

Full automatic floating brush suspension

The side brushes as well as the roller brush look after themselves without any manual adjustments during the full lifetime of the brushes.

Sprinkler system

1600 l water together with the hydraulically driven water pump almost guarantees dust free sweeping. Water ramps are available in front of each side brush, behind the roller brush and in front of the truck.

Fashioned hydraulic system

The power for the sweeper unit is taken from the PTO from the truck engine. The sweeping unit comes with an unique load sensing pump which delivers at any time the correct pressure and oil flow. The valve block is mounted behind easy accessible cover.
